

## LMx93-N, LM2903-N Low-Power, Low-Offset Voltage, Dual Comparators

### 1 Features

- Wide Supply
  - Voltage Range: 2.0 V to 36 V
  - Single or Dual Supplies:  $\pm 1.0$  V to  $\pm 18$  V
- Very Low Supply Current Drain (0.4 mA) — Independent of Supply Voltage
- Low Input Biasing Current: 25 nA
- Low Input Offset Current:  $\pm 5$  nA
- Maximum Offset voltage:  $\pm 3$  mV
- Input Common-Mode Voltage Range Includes Ground
- Differential Input Voltage Range Equal to the Power Supply Voltage
- Low Output Saturation Voltage: 250 mV at 4 mA
- Output Voltage Compatible with TTL, DTL, ECL, MOS and CMOS logic systems
- Available in the 8-Bump (12 mil) DSBGA Package
- See AN-1112 ([SNVA009](#)) for DSBGA Considerations
- Advantages
  - High Precision Comparators
  - Reduced  $V_{OS}$  Drift Over Temperature
  - Eliminates Need for Dual Supplies
  - Allows Sensing Near Ground
  - Compatible with All Forms of Logic
  - Power Drain Suitable for Battery Operation

### 2 Applications

- Battery powered applications
- Industrial applications

### 3 Description

The LM193-N series consists of two independent precision voltage comparators with an offset voltage specification as low as 2.0 mV max for two comparators which were designed specifically to operate from a single power supply over a wide range of voltages. Operation from split power supplies is also possible and the low power supply current drain is independent of the magnitude of the power supply voltage. These comparators also have a unique characteristic in that the input common-mode voltage range includes ground, even though operated from a single power supply voltage.

Application areas include limit comparators, simple analog to digital converters; pulse, squarewave and time delay generators; wide range VCO; MOS clock timers; multivibrators and high voltage digital logic gates. The LM193-N series was designed to directly interface with TTL and CMOS. When operated from both plus and minus power supplies, the LM19-N series will directly interface with MOS logic where their low power drain is a distinct advantage over standard comparators.

The LM393 and LM2903 parts are available in TI's innovative thin DSBGA package with 8 (12 mil) large bumps.

#### Device Information<sup>(1)</sup>

PART NUMBER	PACKAGE	BODY SIZE (NOM)
LM193-N	TO-99 (8)	9.08 mm x 9.08 mm
LM293-N		
LM393-N	SOIC (8)	4.90 mm x 3.91 mm
LM2903-N		

(1) For all available packages, see the orderable addendum at the end of the datasheet.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

 over operating free-air temperature range (unless otherwise noted)<sup>(1)(2)(3)</sup>

			MIN	MAX	UNIT
Differential Input Voltage <sup>(4)</sup>				36	V
Input Voltage			-0.3	36	V
Input Current (V <sub>IN</sub> <-0.3 V) <sup>(5)</sup>				50	mA
Power Dissipation <sup>(6)</sup>	PDIP			780	mW
	TO-99			660	mW
	SOIC			510	mW
	DSBGA			568	mW
Output Short-Circuit to Ground <sup>(7)</sup>				Continu ous	
Lead Temperature (Soldering, 10 seconds)				260	°C
Soldering Information	PDIP Package Soldering (10 seconds)			260	°C
	SOIC Package	Vapor Phase (60 seconds)		215	°C
		Infrared (15 seconds)			220
Storage temperature, T <sub>stg</sub>			-65	150	°C

- (1) *Absolute Maximum Ratings* indicate limits beyond which damage may occur. *Recommended Operating Conditions* indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and test conditions, see the Electrical Characteristics.
- (2) Refer to RETS193AX for LM193AH military specifications and to RETS193X for LM193H military specifications.
- (3) If Military/Aerospace specified devices are required, please contact the TI Sales Office/Distributors for availability and specifications.
- (4) Positive excursions of input voltage may exceed the power supply level. As long as the other voltage remains within the common-mode range, the comparator will provide a proper output state. The low input voltage state must not be less than -0.3V (or 0.3V below the magnitude of the negative power supply, if used).
- (5) This input current will only exist when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistors becoming forward biased and thereby acting as input diode clamps. In addition to this diode action, there is also lateral NPN parasitic transistor action on the IC chip. This transistor action can cause the output voltages of the comparators to go to the  $V^+$  voltage level (or to ground for a large overdrive) for the time duration that an input is driven negative. This is not destructive and normal output states will re-establish when the input voltage, which was negative, again returns to a value greater than -0.3V.
- (6) For operating at high temperatures, the LM393 and LM2903 must be derated based on a 125°C maximum junction temperature and a thermal resistance of 170°C/W which applies for the device soldered in a printed circuit board, operating in a still air ambient. The LM193/LM193A/LM293 must be derated based on a 150°C maximum junction temperature. The low bias dissipation and the "ON-OFF" characteristic of the outputs keeps the chip dissipation very small ( $P_D \leq 100$  mW), provided the output transistors are allowed to saturate.
- (7) Short circuits from the output to  $V^+$  can cause excessive heating and eventual destruction. When considering short circuits to ground, the maximum output current is approximately 20 mA independent of the magnitude of  $V^+$ .

### 7.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±1300	V

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

	MIN	NOM	MAX	UNIT
Supply Voltage ( $V^+$ ) - Single Supply	2.0		36	V
Supply Voltage ( $V^+$ ) - Dual Supply	±1.0		±18	V
Operating Input Voltage on ( $V_{IN}$ pin)	0	( $V^+$ ) -1.5V		V
Operating junction temperature, $T_J$ : LM193/LM193A	-55		125	°C
Operating junction temperature, $T_J$ : LM2903	-40		85	°C
Operating junction temperature, $T_J$ : LM293	-25		85	°C
Operating junction temperature, $T_J$ : LM393	0		70	°C

## 7.4 Thermal Information

THERMAL METRIC <sup>(1)</sup>	UNIT
R <sub>θJA</sub> Junction-to-ambient thermal resistance	170 °C/W

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## 7.5 Electrical Characteristics: LM193A V<sup>+</sup> = 5 V, T<sub>A</sub> = 25°C

Unless otherwise stated.

PARAMETER	TEST CONDITIONS	LM193A			UNIT
		MIN	TYP	MAX	
Input Offset Voltage	See <sup>(1)</sup> .		1.0	2.0	mV
Input Bias Current	I <sub>IN</sub> (+) or I <sub>IN</sub> (-) with Output in Linear Range, V <sub>CM</sub> = 0 V <sup>(2)</sup>		25	100	nA
Input Offset Current	I <sub>IN</sub> (+) - I <sub>IN</sub> (-) V <sub>CM</sub> = 0 V		3.0	25	nA
Input Common Mode Voltage Range	V <sub>+</sub> = 30 V <sup>(3)</sup>	0		V <sup>+</sup> - 1.5	V
Supply Current	R <sub>L</sub> = ∞ V <sup>+</sup> = 5 V		0.4	1	mA
	V <sup>+</sup> = 36 V		1	2.5	mA
Voltage Gain	R <sub>L</sub> ≥ 15 kΩ, V <sup>+</sup> = 15 V V <sub>O</sub> = 1 V to 11 V	50	200		V/mV
Large Signal Response Time	V <sub>IN</sub> = TTL Logic Swing, V <sub>REF</sub> = 1.4 V V <sub>RL</sub> = 5V, R <sub>L</sub> = 5.1 kΩ		300		ns
Response Time	V <sub>RL</sub> = 5V, R <sub>L</sub> = 5.1 kΩ <sup>(4)</sup>		1.3		μs
Output Sink Current	V <sub>IN</sub> (-) = 1V, V <sub>IN</sub> (+) = 0, V <sub>O</sub> ≈ 1.5 V	6.0	16		mA
Saturation Voltage	V <sub>IN</sub> (-) = 1V, V <sub>IN</sub> (+) = 0, I <sub>SINK</sub> ≤ 4 mA		250	400	mV
Output Leakage Current	V <sub>IN</sub> (-) = 0, V <sub>IN</sub> (+) = 1V, V <sub>O</sub> = 5 V		0.1		nA

- (1) At output switch point, V<sub>O</sub> ≈ 1.4V, R<sub>S</sub> = 0 Ω with V<sup>+</sup> from 5V to 30V; and over the full input common-mode range (0V to V<sup>+</sup> - 1.5V), at 25°C.
- (2) The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the reference or input lines.
- (3) The input common-mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common-mode voltage range is V<sup>+</sup> - 1.5 V at 25°C, but either or both inputs can go to 36 V without damage, independent of the magnitude of V<sup>+</sup>.
- (4) The response time specified is for a 100 mV input step with 5 mV overdrive. For larger overdrive signals 300 ns can be obtained, see [LMx93 and LM193A Typical Characteristics](#).

## 7.6 Electrical Characteristics: LM193A (V<sub>+</sub> = 5 V)<sup>(1)</sup>

PARAMETER	TEST CONDITIONS	LM193A			UNIT
		MIN	TYP	MAX	
Input Offset Voltage	See <sup>(2)</sup>			4.0	mV
Input Offset Current	I <sub>IN</sub> (+) - I <sub>IN</sub> (-), V <sub>CM</sub> = 0 V			100	nA
Input Bias Current	I <sub>IN</sub> (+) or I <sub>IN</sub> (-) with Output in Linear Range, V <sub>CM</sub> = 0 V <sup>(3)</sup>			300	nA
Input Common Mode Voltage Range	V <sup>+</sup> = 30 V <sup>(4)</sup>	0		V <sup>+</sup> - 2.0	V
Saturation Voltage	V <sub>IN</sub> (-) = 1V, V <sub>IN</sub> (+) = 0, I <sub>SINK</sub> ≤ 4 mA			700	mV
Output Leakage Current	V <sub>IN</sub> (-) = 0, V <sub>IN</sub> (+) = 1V, V <sub>O</sub> = 30 V			1.0	μA
Differential Input Voltage	Keep All V <sub>IN</sub> 's ≥ 0 V (or V <sup>-</sup> , if Used), <sup>(5)</sup>			36	V

- (1) These specifications are limited to -55°C ≤ T<sub>A</sub> ≤ +125°C, for the LM193/LM193A. With the LM293 all temperature specifications are limited to -25°C ≤ T<sub>A</sub> ≤ +85°C and the LM393 temperature specifications are limited to 0°C ≤ T<sub>A</sub> ≤ +70°C. The LM2903 is limited to -40°C ≤ T<sub>A</sub> ≤ +85°C.
- (2) At output switch point, V<sub>O</sub> ≈ 1.4V, R<sub>S</sub> = 0 Ω with V<sup>+</sup> from 5V to 30V; and over the full input common-mode range (0V to V<sup>+</sup> - 1.5V), at 25°C.
- (3) The direction of the input current is out of the IC due to the PNP input stage. This current is essentially constant, independent of the state of the output so no loading change exists on the reference or input lines.
- (4) The input common-mode voltage or either input signal voltage should not be allowed to go negative by more than 0.3V. The upper end of the common-mode voltage range is V<sup>+</sup> - 1.5 V at 25°C, but either or both inputs can go to 36 V without damage, independent of the magnitude of V<sup>+</sup>.
- (5) Positive excursions of input voltage may exceed the power supply level. As long as the other voltage remains within the common-mode range, the comparator will provide a proper output state. The low input voltage state must not be less than -0.3V (or 0.3V below the magnitude of the negative power supply, if used).

## 7.7 Electrical Characteristics: LMx93 and LM2903 $V^+ = 5\text{ V}$ , $T_A = 25^\circ\text{C}$

Unless otherwise stated.

Figure 5. Response Time for Various Input Overdrives—Positive Transition

## 7.10 Typical Characteristics: LM2903

## 8 Detailed Description

### 8.1 Overview

The LM139 provides two independently functioning, high-precision, low  $V_{OS}$  drift, low input bias current comparators in a single package. The low power consumption of 0.4mA at 5V and the 2.0V supply operation makes the LM139 suitable for battery powered applications.

### 8.2 Functional Block Diagram

**Figure 11. Basic Comparator**

### 8.3 Feature Description

The input bias current of 25 nA enables the LM193 to use even very high impedance nodes as inputs. The differential voltage input range equals the supply voltage range.

The LM193 can be operated with a single supply, where  $V+$  can be from 2.0 V to 36 V, or in a dual supply voltage configuration, where GND pin is used as a  $V-$  supply. The supply current draws only 0.4 mA for both comparators.

The output of each comparator in the LM193 is the open collector of a grounded-emitter NPN output transistor which can typically draw up to 16mA.

### 8.4 Device Functional Modes

A basic comparator circuit is used for converting analog signals to a digital output. The output is HIGH when the voltage on the non-inverting (+IN) input is greater than the inverting (-IN) input. The output is LOW when the voltage on the non-inverting (+IN) input is less than the inverting (-IN) input. The inverting input (-IN) is also commonly referred to as the "reference" or "VREF" input. All pins of any unused comparators should be tied to the negative supply.

## 9 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 9.1 Application Information

The LM193 series are high gain, wide bandwidth devices which, like most comparators, can easily oscillate if the output lead is inadvertently allowed to capacitively couple to the inputs via stray capacitance. This shows up only during the output voltage transition intervals as the comparator change states. Power supply bypassing is not required to solve this problem. Standard PC board layout is helpful as it reduces stray input-output coupling. Reducing the input resistors to < 10 k $\Omega$  reduces the feedback signal levels and finally, adding even a small amount (1.0 to 10 mV) of positive feedback (hysteresis) causes such a rapid transition that oscillations due to stray feedback are not possible. Simply socketing the IC and attaching resistors to the pins will cause input-output oscillations during the small transition intervals unless hysteresis is used. If the input signal is a pulse waveform, with relatively fast rise and fall times, hysteresis is not required.

All input pins of any unused comparators should be tied to the negative supply.

The bias network of the LM193 series establishes a drain current which is independent of the magnitude of the power supply voltage over the range of from 2.0 V<sub>DC</sub> to 30 V<sub>DC</sub>.

The differential input voltage may be larger than V<sup>+</sup> without damaging the device [Typical Applications](#). Protection should be provided to prevent the input voltages from going negative more than -0.3 V<sub>DC</sub> (at 25°C). An input clamp diode can be used as shown in [Typical Applications](#).

The output of the LM193 series is the uncommitted collector of a grounded-emitter NPN output transistor. Many collectors can be tied together to provide an output OR'ing function. An output pullup resistor can be connected to any available power supply voltage within the permitted supply voltage range and there is no restriction on this voltage due to the magnitude of the voltage which is applied to the V<sup>+</sup> terminal of the LM193 package. The output can also be used as a simple SPST switch to ground (when a pullup resistor is not used). The amount of current which the output device can sink is limited by the drive available (which is independent of V<sup>+</sup>) and the  $\beta$  of this device. When the maximum current limit is reached (approximately 16mA), the output transistor will come out of saturation and the output voltage will rise very rapidly. The output saturation voltage is limited by the approximately 60 $\Omega$  r<sub>SAT</sub> of the output transistor. The low offset voltage of the output transistor (1.0mV) allows the output to clamp essentially to ground level for small load currents.

### 9.2 Typical Applications

#### 9.2.1 Basic Comparator

Figure 12. Basic Comparator

##### 9.2.1.1 Design Requirements

The basic usage of a comparator is to indicate when a specific analog signal has exceeded some predefined threshold. In this application, the negative input (IN-) is tied to a reference voltage, and the positive input (IN+) is connected to the input signal. The output is pulled up with a resistor to the logic supply voltage, V<sup>+</sup> with a pullup resistor.

For an example application, the supply voltage is 5V. The input signal varies between 1 V and 3 V, and we want to know when the input exceeds 2.5 V $\pm$ 1%. The supply current draw should not exceed 1 mA.

## Typical Applications (continued)

### 9.2.1.2 Detailed Design Procedure

First, we determine the biasing for the 2.5-V reference. With the 5-V supply voltage, we would use a voltage divider consisting of one resistor from the supply to IN<sup>-</sup> and an second resistor from IN<sup>-</sup>. The 25 nA of input current bias should be < 1% of the bias current for V<sub>ref</sub>. With a 100-kΩ resistor from IN<sup>-</sup> to V<sub>+</sub> and an additional 100-kΩ resistor from IN<sup>-</sup> to ground, there would be 25 μA of current through the two resistors. The 3-kΩ pullup shown will need  $5\text{ V}/3\text{ k}\Omega \rightarrow 1.67\text{ mA}$ , which exceeds our current budget.

With the 400-μA supply current and 25 μA of V<sub>REF</sub> bias current, there is 575 μA remaining for output pullup resistor; with 5-V supply, we need a pullup larger than 8.7 kΩ. A 10-kΩ pullup is a value that is commonly available and can be used here.

## 10 Power Supply Recommendations

Even in low frequency applications, the LM139-N can have internal transients which are extremely quick. For this reason, bypassing the power supply with  $1.0\mu\text{F}$  to ground will provide improved performance; the supply bypass capacitor should be placed as close as possible to the supply pin and have a solid connection to ground. The bypass capacitor should have a low ESR and also a SRF greater than 50MHz.

## 11 Layout

### 11.1 Layout Guidelines

Try to minimize parasitic impedances on the inputs to avoid oscillation. Any positive feedback used as hysteresis should place the feedback components as close as possible to the input pins. Care should be taken to ensure that the output pins do not couple to the inputs. This can occur through capacitive coupling if the traces are too close and lead to oscillations on the output. The optimum placement for the bypass capacitor is closest to the V+ and ground pins. Take care to minimize the loop area formed by the bypass capacitor connection between V+ and ground. The ground pin should be connected to the PCB ground plane at the pin of the device. The feedback components should be placed as close to the device as possible minimizing strays.

### 11.2 Layout Example

**Figure 38. Layout Example**

## 12 Device and Documentation Support

### 12.1 Related Links

The table below lists quick access links. Categories include technical documents, support and community resources, tools and software, and quick access to sample or buy.

### 12.2 Trademarks

All trademarks are the property of their respective owners.

### 12.3 Electrostatic Discharge Caution

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

### 12.4 Glossary

[SLYZ022](#) — *TI Glossary*.

This glossary lists and explains terms, acronyms, and definitions.

## 13 Mechanical, Packaging, and Orderable Information

The following pages include mechanical, packaging, and orderable information. This information is the most current data available for the designated devices. This data is subject to change without notice and revision of this document. For browser-based versions of this data sheet, refer to the left-hand navigation.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.
